Samsung Electronics Equity Research

기준일: 2026-10-10 | KRW bn, 원/주

결론

기준 SOTP는 **361,786원**입니다. DS 메모리 이익을 제품군별로 나누고 DX | SDC | Harman의 정상화 이익 및 파운드리 시나리오를 합산했습니다. 3Q26 자료는 기존 저장소에서 잠정치로 표시된 수치이며, 확정 세부 실적이 반영되기 전까지 잠정 | 미공개 항목을 확정값처럼 사용하지 않습니다.

모델	주당 결과	역할	핵심 읽기
SOTP	361,786원	중심값. 사업별 이익과 자본집약도를 분리	
DCF	423,485원	교차검증. 연결 현금전환 및 CAPEX 부담	
Segment PER	326,000원	교차검증. 정상화 EPS 50,000원, Foundry/S.LSI 적자 EPS는 N/M	
RIM	173,444원	하방 점검. ROE가 자본비용으로 하락하는 경우	

기준 주가는 2026-10-09 종가 262,000원입니다. 네 결과는 역할이 달라 평균하지 않습니다. SOTP와 DCF의 차이는 특히 2027E 순현금 350조원 시나리오와 terminal value 민감성을 검증해야 한다는 신호로 해석합니다.

실적과 전망

구분	매출	영업이익	순이익	주의할 점
1Q26	133.9조원	57.2조원	47.2조원	DS 중심 회복
2Q26	171.5조원	89.5조원	71.6조원	DS 영업이익 89.2조원
3Q26 잠정	195.0조원	107.4조원	미공개	세부 사업부	순이익 미공개

2Q26 메모리 사업은 HBM4 판매를 확대했고 HBM4E 샘플을 주요 고객에게 출하했습니다. 회사는 하반기 서버 DRAM | eSSD | HBM 수요가 공급 부족을 이어갈 것으로 봤습니다.

valuation 원칙

DS 메모리: HBM 26% | 9.0x, Server DRAM 34% | 7.0x, Client/mobile DRAM 22% | 4.5x, NAND 14% | 3.0x, 기타 4% | 2.5x. 유효 EV/EBIT는 6.2x

파운드리 | S.LSI: TSMC를 기술 | CAPEX 비교 기준점으로 두되 보수적으로 반영

DX: 스마트폰 | TV | 가전의 정상화 이익에 낮은 multiple 적용

SDC | Harman: OLED와 전장 이익의 개별 정상화 multiple 적용

DCF: 연결 매출 | 영업이익 기반 FCFF로 CAPEX와 운전자본 후 현금 전환을 점검하며 SOTP를 교차 검증

순현금: 2027E 350조원은 보고치가 아니라 시나리오 입력이며 DCF/SOTP에서 동일 입력을 공유한다. 2Q26 실제 순현금에서 출발하는 현금 브리지는 아직 추가 검증이 필요하다

DCF: WACC 9.0%, 장기성장률 2.5%. 명시기간 FCFF 현재가치는 654,791bn, terminal value 현재가치는 1,522,989bn이며 총 지분가치는 2,527,780bn이다. terminal value가 DCF 지분가치의 약 60%이므로 WACC | 장기성장률 민감도를 함께 읽는다.

RIM: 기초 자기자본 600,000bn, 자기자본비용 10.0%, ROE 30.0%에서 2030년 10.4%로 하락, terminal ROE 12.0%와 성장률 2.5%를 적용했다. 장기 잔여이익 공식에는 다음 기간 성장 **(1+g)**를 포함한다.

Segment PER: HBM | 서버 DRAM EPS 16,000원 × 8배, 범용 메모리 EPS 16,000원 × 4.5배, DX | SDC | Harman EPS 18,000원 × 7배를 합산했다. 적자 Foundry/S.LSI는 N/M으로 제외한다. 이는 전사 peer 평균이 아니라 정상화 EPS 시나리오의 교차검증이다.

HBM 9.0x와 나머지 memory scenario multiples는 가설적 입력이다. 이를 정당화하려면 고객 인증 | 수율 | 출하 | 현금전환이 함께 확인되어야 한다. AI 수요라는 단어만으로 프리미엄을 주지 않고, 제품 mix 개선이 EBIT 전망에 이미 들어갔다면

multiple에 다시 더하지 않는다.

삼성전자는 하나의 전사 peer median으로 평가하지 않는다. HBM/server DRAM, 범용 DRAM/NAND, foundry, DX, SDC, Harman 각각의 이익풀과 적합한 metric을 구분한다. 적자 Foundry & S.LSI는 PER에서 N/M 처리하며, SOTP의 회복 시나리오가 별도로 경제적 가치를 다룬다. SK hynix | Micron | TSMC | Apple/Xiaomi | LG Display는 모두 서로 다른 비교 역할을 하며, 다수는 segment operating benchmark 또는 demand proxy다. 직접 비교 가능성, 사이클, CAPEX, 이익기간, 기준일을 충족하지 않으면 수치 평균에 포함하지 않는다. 상세 방법론은 **report/METHODOLOGY_APPENDIX.md**와 **research/** 문서 4종에 기록했다.

Vintage 주의

저장소의 현 valuation snapshot 날짜는 2026-10-10이며, 3Q26는 잠정치로 분리한다. 모든 시장가격과 peer 추정치는 동일 cutoff가 확인되기 전까지 과거 스냅샷이다. 새 확정 실적 이후 actual, segment forecast, peer market data, valuation parameter의 가치 기여도를 각각 분리해 업데이트한다.

다음 갱신

1. 3Q26 확정 매출 | 영업이익 | 순이익
2. DS 메모리 | 파운드리, DX, SDC, Harman 세부 손익
3. 2nm 수율 | 수주, HBM4 | HBM4E 고객 인증
4. 현금 | 차입금 | CAPEX | 발행주식수

Methodology Appendix - Samsung Electronics

Project valuation snapshot: 2026-10-10. Existing 3Q26 consolidated revenue and operating profit figures are marked preliminary; do not infer net income or segment outcomes from them. See [**VALUATION_VINTAGE_POLICY.md**](../research/VALUATION_VINTAGE_POLICY.md) for the refresh protocol.

1. Why sector and segment decomposition matters

Samsung's memory, foundry, devices, display and automotive operations have different cycles, capital intensity and earnings denominators. A consolidated peer average would mix peak memory earnings with structurally different businesses. SOTP is therefore the primary structure; DCF tests cash conversion and RIM tests return fade. Segment PER is only a cross-check and uses normalized earnings pools.

2. Peer rationale and exclusion discipline

Candidate	Allowed role	Inclusion rationale	Why it is not a plug-in multiple
SK hynix	HBM/server DRAM operating and valuation anchor	Integrated DRAM/HBM, own fabs, CAPEX and cycle exposure	Memory concentration, customer/mix and earnings duration differ
Micron	DRAM/NAND cycle cross-check	Memory manufacturing, ASP, yield and inventory economics	Normalize product mix, cycle timing, geography and accounting
TSMC	Foundry process/utilization/capex benchmark	Leading-edge foundry economics	Scale, utilization and external customer mix differ materially
Apple/Xiaomi	DX demand and mix proxy	Device pricing and end-market demand	Different asset and software/ecosystem economics
LG Display	OLED cycle/operations benchmark	Panel utilization, customer and investment cycle	Scale, balance sheet, product mix and customer concentration differ

Numeric peer inclusion requires comparable segment exposure, usable normalized earnings, synchronized market date/forecast period, consistent EV or equity denominator, and dated source metadata. If any gate fails, show the company only as an operating benchmark or demand proxy. Never mix EV/EBIT with PER into one median.

3. Memory scenario multiple architecture

The current 2027E memory EBIT allocation is HBM 26% at 9.0x; server DRAM 34% at 7.0x; client/mobile DRAM 22% at 4.5x; NAND 14% at 3.0x; other 4% at 2.5x. The weighted result is 6.23x. Those are analyst scenarios, not disclosed profits by product or proven fair-value coefficients.

A future change requires dated evidence across qualification/yield, customer concentration, margin and cash conversion, supply response, cycle duration and incremental ROIC. Higher forecast EBIT already captures shipment/mix gains; the multiple captures only residual risk, duration and capital-return differences. An HBM mix increase mechanically changes the weighted result, so no second company-wide premium is applied. See [**MEMORY_PREMIUM_FRAMEWORK.md**](../research/MEMORY_PREMIUM_FRAMEWORK.md).

4. Distinct business tests

Memory: ASP/bit mix, inventory, utilization, depreciation, maintenance and growth capex; normalize through a full cycle.

Foundry/S.LSI: node yield, external customer production, utilization, loss and capex payback; do not assign PER during losses.

DX: MX premium mix and sell-through; VD/DA promotion and inventory; avoid demand proxies as valuation peers.

SDC: mobile OLED customer concentration, utilization and new IT/auto lines' capital returns.

Harman: backlog-to-revenue conversion, software/content mix, margin and working capital.

5. Vintage controls

Use one market-close date for Samsung and peers; preserve the latest reported period, preliminary periods, forecast provider/date, FX, shares, cash/debt and non-controlling interests. Keep old vintages in the changelog. Bridge valuation change into: (a) actuals, (b) operating forecast, (c) peer data, and (d) valuation parameters. The file [**2026-10-10_actuals_and_assumptions.csv**](../data/processed/2026-10-10_actuals_and_assumptions.csv) is an input snapshot, not a live feed.

Analysis Review - Samsung Electronics

Review date: 2026-10-12 **Latest confirmed actuals in model:** 2Q2026; 3Q2026 consolidated sales / operating profit remain labelled preliminary

What was weak and what changed

Area	Review finding	Improvement in this revision	Remaining evidence gate
Loss-making segment PER	Foundry & S.LSI had negative normalized EPS multiplied by a positive 2x PER, producing a negative value contribution. This conflicts with the model's own rule to exclude negative EPS.	Foundry EPS is now excluded from the PER denominator (**N/M**, zero contribution to PER). The note explicitly says zero means excluded from PER, not zero economic value. Foundry remains separately represented in SOTP scenarios.	Revisit only after earnings are positive and normalized; use an operating-value approach for losses / turnaround scenarios.
DCF scope	DCF said "normalised DS margins" while its revenue series appeared company-wide, so the enterprise cash-flow perimeter was unclear.	DCF now explicitly uses consolidated revenue and EBIT margin and is identified as a company-level cash-flow cross-check to segment SOTP.	Reconcile consolidated EBIT to segment profits plus corporate / elimination items when reported segment detail is available.
Net cash addition	SOTP and DCF both added KRW 350tn without showing how the 2Q26 reported balance-sheet net cash grows to this 2027 scenario.	DCF now references the single SOTP net-cash input instead of a second embedded hardcode; SOTP labels KRW 350tn as an analyst scenario, not a reported figure.	Build a cash bridge from reported cash/debt through CAPEX, dividends/buybacks, acquisitions, FX and other investing/financing flows. Run a per-share sensitivity on net cash.
Memory premium precision	Product pools are separated, but the 5.5x base and product-specific premium / discount turns are still analyst scenario inputs, not observed fair-value multiples.	The workbook's evidence gates are kept explicit: qualification, yield, shipment, realized margin, cycle normalization, reinvestment and double-count checks. The premium is framed as a scenario, not a peer-derived fact.	Calibrate product multiples against dated segment transactions / comparable memory-cycle data, or show a neutral-base case with HBM uplift only in sensitivities until evidence exists.
RIM terminal value	Terminal residual income previously omitted the next-period growth factor.	The terminal RI formula now includes **(1+g)** before capitalization at **CoE-g**; the workbook output is about KRW 173,444/share.	12% terminal ROE and 2.5% growth remain scenario inputs.
3Q preliminary vs full results	Preliminary group sales / operating profit do not establish segment profitability, net income, cash flow, or balance sheet.	The vintage policy preserves the preliminary label and the 2026-10-29 confirmed-results trigger.	Do not update segment SOTP, net cash or RIM book value from a group-level preliminary release alone.

Company-specific thesis to test

Samsung must be valued as several different businesses: **DS memory** has HBM / server DRAM duration plus cyclical DRAM/NAND; **Foundry & S.LSI** depends on node yield, customer loading and capital intensity; **DX** depends on product mix and component cost; **SDC** is display-cycle and utilization-sensitive; **Harman** has auto/audio order and margin dynamics. AI exposure alone does not justify a premium: incremental profit must survive yield loss, depreciation and reinvestment, then convert to free cash flow.

Peer rule

Use SK hynix / Micron for memory economics, TSMC for foundry operating benchmarks, display peers for OLED-cycle context, and device brands only as demand references for DX. Do not use one conglomerate PER to value all earnings pools. Negative or near-zero EPS is N/M in PER; value turnaround segments through explicit scenario cash flows or operating multiples with a disclosed recovery path.

Release gate

After confirmed 3Q results, reconcile segment EBIT to consolidated EBIT; refresh net cash and equity attribution; rebuild the cash bridge; and rerun product-mix sensitivities before quoting a single central value. Primary-source starting points: Samsung Electronics earnings releases, Samsung earnings presentations, DART.
